

the WORM Flexible RTD and Thermocouple Sensors for Thermowell Temperature Assemblies

Model: **WORM**

The WORM® Flexible Sensor Kits are field-cutable and work in both new and retrofit applications, replacing restrictive straight sensor probes allowing you to stock one sensor for multiple thermowell lengths and configurations. The WORM bends right through the top or face of the enclosure. It slides through the enclosure's conduit port, and into (or out of) the thermowell without having to remove the enclosure or any assembly components.
